Telephone Subscribership in the United States **(Data Through November 2000)**

Executive Summary

This is the Federal Communications Commission's (FCC's) report on telephone subscribership in the United States, presenting subscribership statistics based on the Current Population Survey (CPS) conducted by the Census Bureau in November 2000. Statistics from that survey estimated that 94.1% of all households in the United States had telephone service. It is down 0.3% from the last report, for July 2000, and unchanged from November 1999. The change from July is not statistically significant. The report also shows subscribership levels by state, income level, race, age, household size, and employment status.

Statistical Findings

In November 2000:

- The telephone subscribership penetration rate in the U.S. was 94.1%, unchanged from the previous year.
- The telephone penetration rate was 80.4% for households with annual incomes below \$5,000, while the rate for households with incomes above \$60,000 was 98.3%.
- By state, the penetration rates ranged from a low of 86.6% in Arkansas to a high of 97.9% in Minnesota.
- Households headed by whites had a penetration rate of 94.9%, while those headed by blacks had a rate of 88.9% and those headed by Hispanics had a rate of 90.4%.
- By age, penetration rates ranged from 87.4% for households headed by a person under 25 to 95.5% for households headed by a person between 55 and 59.
- Households with one person had a penetration rate of 91.0%, compared to a rate of 95.5% for households with four or five persons.
- The penetration rate for unemployed adults was 90.1%, while the rate for employed adults was 95.5%.

Background

The number and percentage of households that have telephone service represent the most fundamental measures of the extent of universal service. Continuing analysis of telephone penetration statistics allows us to examine the aggregate effects of Commission actions on households' decisions to maintain, acquire or drop telephone service. This report presents comprehensive data on telephone penetration statistics collected by the Bureau of the Census under contract with the Federal Communications Commission. Along with telephone penetration statistics for the United States and each of the states from November 1983 to November 2000, data are provided on penetration based on various demographic characteristics.

The most widely used measure of telephone subscribership is the percentage of households with telephone service, sometimes called a measure of telephone penetration. Prior to the 1980s, precise measurements of telephone subscribership received little attention. Traditionally, telephone penetration was measured by dividing the number of residential telephone lines by the number of households. Measures of penetration based on the number of residential lines, however, became subject to a large

margin of error as more and more households added second telephone lines and more consumers acquired second homes. By 1980, the traditional penetration measure (residential lines divided by the number of households) reached 96%, while the number of households reporting that they had telephones in the 1980 census was 92.9%.

Recognizing the need for more precise periodic measurements of subscribership, the Commission requested that the Bureau of the Census include questions on telephone availability as part of its Current Population Survey (CPS), which monitors demographic trends between the decennial censuses. This survey is a staggered panel survey in which the people residing at particular addresses are included in the survey for four consecutive months in one year and the same four months in the following year. Use of the CPS has several advantages: it is conducted every month by an independent and expert agency, the sample is large, and the questions are consistent. Thus, changes in the results can be compared over time with a great deal of confidence.

Unfortunately, the results of the CPS cannot be directly compared with the penetration figures contained in the 1980 and 1990 decennial censuses. This is due to differences in sampling techniques and survey methodologies and because of differences in the context in which the questions were asked. The 1990 decennial census reported 94.8% of all households in the United States had telephones, whereas the CPS data showed a penetration rate of 93.3% for 1990. This difference is statistically significant and appears to indicate that the CPS value may be on the low side and the decennial census value may be on the high side, with the most probable value lying somewhere in between. In the 2000 decennial census the telephone question was changed from asking whether there was a telephone instrument to asking whether there was telephone service.

The specific questions asked in the CPS are: "Is there a telephone in this house/apartment?" and, if the answer to the first question is "no," this is followed up with, "Is there a telephone elsewhere on which people in this household can be called?" If the answer to the first question is "yes," the household is counted as having a telephone "in unit." If the answer to either the first or second question is "yes," the household is counted as having a telephone "available." The "in unit" data are reported in all of the tables and charts in this report. The "available" data are also reported in Tables 3 through 12 and Charts 1 and 8.

Although the survey is conducted every month, not all questions are asked every month. The telephone questions are asked once every four months, in the month that a household is first included in the sample and in the month that the household reenters the sample a year later. Since the sample is staggered, the reported information for any given month actually reflects responses over the preceding four months. Aggregated summaries of the responses are reported to the Commission, based on the surveys conducted through March, July, and November of each year.

The Census Bureau data are based on a nationwide sample of about 48,000 households in the 50 states and the District of Columbia. (The CPS does not cover outlying areas that are not states, such as Puerto Rico, Guam, the Virgin Islands, and the Northern Mariana Islands.) Because a sample is used, the estimates are subject to sampling error. For the nationwide totals, changes in telephone penetration between consecutive reports of less than 0.4% may be due to sampling error and cannot be regarded as statistically significant. As explained below, when comparing the same month in two consecutive years, changes of less than or equal to 0.3% are not statistically significant. When comparing annual averages, changes of less than or equal to 0.2% are not statistically significant. The

annual averages are the average of the three surveys of the year in question. For individual states or other subgroups of the U.S. population, the amount of sampling variability is much greater, because the sample sizes are smaller. This will require larger changes to yield statistical significance at the same confidence level.

The data in this report are not seasonally adjusted. After adjusting for the trend over time, there is an average increase of 0.2% between November and March, followed by an average decrease of 0.1% between March and July, and another average 0.1% decrease between July and November. However, these changes are not statistically significant.

Results and Statistical Analysis

Census Bureau figures for November 2000, the most recent data available, show that the percentage of households subscribing to telephone service is 94.1%, which is unchanged from November 1999. The average penetration rate for the year 2000 was 94.4%, which is up 0.2% from the 1999 average. This change is not statistically significant. As a result of an increasing number of households, 1.1 million households were added to the nation's telephone system between November 1999 and November 2000.

This report includes figures showing subscribership percentages by state, by the head of the household's age and race, by household size, by income, and for adult individuals by labor force status. The November 2000 data show that 94.8% of adult individuals in the civilian non-institutionalized population have a telephone in their household. This figure is down 0.3% from the November 1999 level. The average penetration rate for 2000 was 95.1% for adult individuals, which is down 0.1% from the 1999 average. These decreases are not statistically significant.

This report contains twelve tables and eight charts presenting penetration statistics for various geographic and demographic characteristics. The charts and the first two tables present summaries of the available information. Tables 3 through 7 present more detailed information. In these tables, only the annual averages are included for the years 1984 through 1997. March, July, and November data for those years are available in previous subscribership reports or Monitoring Reports in CC Docket Nos. 87-339 or 98-202. Tables 8 through 12 provide information necessary to determine the statistical significance of changes in the penetration rates over time.

Table 1 summarizes the telephone penetration for the United States, combining information on the number of households with the penetration rates.

Chart 1 graphically depicts the nationwide penetration rates for households over time.

Table 2 summarizes the telephone penetration rates by state, showing the average rates for 1984 and 2000, the change between those two years, and an indication as to whether the change is statistically significant. The statistical significance of a change is determined not only by the magnitude of that change, but also by the sizes of the samples used to estimate the change.

Chart 2 depicts the states with average year 2000 penetration rates (as shown in Table 2) more than 1% below the national average, within 1% of the national average, or more than 1% above the national average.

Chart 3 depicts changes in household penetration rates by state (as shown in Table 2) between the average year 1984 and year 2000 rates. States with statistically significant increases or decreases are shown, along with other states with increases or decreases.

Chart 4 depicts the relationship between telephone penetration and household income, using average year 2000 penetration rates, for all households, and for households headed by white, black, and Hispanic persons. It is based on data in Table 4.

Chart 5 depicts the relationship between telephone penetration and household size, using average year 2000 penetration rates, for all households, and for households headed by white, black, and Hispanic persons. It is based on data in Table 5.

Chart 6 depicts the relationship between telephone penetration and the head of the household's age, using average year 2000 penetration rates, for all households, and for households headed by white, black, and Hispanic persons. It is based on data in Table 6.

Chart 7 depicts the relationship between telephone penetration and labor force status for civilian non-institutionalized adults, using average year 2000 penetration rates, for all adults, and for white, black, and Hispanic adults. It is based on data in Table 7.

Chart 8 graphically depicts the nationwide penetration rates for civilian non-institutionalized adults over time. It is also based on data in Table 7.

Table 3 shows the Current Population Survey responses for the United States and for each state beginning with November 1983. Because the Current Population Survey began collecting this data only in 1983, comparable values are not available prior to November 1983. For each of the surveys, the column headed "Unit" indicates the percentage of households for which there is a telephone in the housing unit. The column headed "Avail." indicates the percentage of households which have telephone service available for incoming calls, either in the housing unit or elsewhere (such as at work or at a neighbor's home).

Table 4 shows the nationwide penetration rates for households by income and the race of the head of the household. It shows a strong relationship between income and penetration. Caution should be used in comparing these figures over time, because these income levels are not adjusted for inflation. Thus, the same nominal income level at two points in time will reflect different real incomes in terms of purchasing power.¹ Also, the income categories have changed over time due to the changing value of the dollar.

Table 5 shows the nationwide penetration rates for households by the size of the household and the race of the head of the household. It shows that penetration is higher for households of 2 to 5 people than it is for single-person households or those with 6 or more people.

Table 6 shows the nationwide penetration rates for households by the age and race of the head of the household. It shows that the penetration rate is lowest for young and non-white households.

1 Our publication *Telephone Penetration by Income by State* does make adjustments for inflation, making comparisons over time more appropriate.

Table 7 shows the nationwide penetration rates for all persons that are at least 15 years old in the civilian non-institutionalized population by their race and employment status. Since this table is for individual adults rather than households, the total penetration rates are different from those in the previous tables. It shows that penetration is lowest among the unemployed.

Tables 8 through 12 present the critical values at the 95% confidence level for testing the statistical significance of changes in penetration rates over time in the earlier tables. These critical values are relevant because changes less than or equal to the values shown are likely to be due to sampling error and thus cannot be regarded as demonstrating that a change in telephone penetration has occurred. In some cases these critical values are very large because the sample sizes are very small for these subcategories, rendering the changes in estimated penetration rates unreliable. Because there is an overlap of half of the sample from year to year, but no overlap in the sample between surveys that are four months apart, annual changes are less subject to variations in sampling error. Consequently, the critical values should be multiplied by 0.8 when making a comparison for the same month in two consecutive years. When comparing the annual averages, the critical values should be multiplied by 0.5774, since these averages are based on three surveys and hence have a lower standard error. When comparing annual averages of two consecutive years, the critical values should be multiplied by .46, taking into account both of the above factors. The values in these tables were revised substantially in our last report as a result of the first revision made by CPS in their estimates of sampling variability since they began collecting the telephone availability information.

Customer Response

Publication: Telephone Subscribership in the United States (Data Through November 2000)

You can help us provide the best possible information to the public by completing this form and returning it to the Industry Analysis Division of the FCC's Common Carrier Bureau.

1. Please check the category that best describes you:

- Press
 - Current telecommunications carrier
 - Potential telecommunications carrier
 - Business customer evaluating vendors/service options
 - Consultant, law firm, lobbyist
 - Other business customer
 - Academic/student
 - Residential customer
 - FCC employee
 - Other federal government employee
 - State or local government employee
 - Other (please specify)

2. Please rate the report: Excellent Good Satisfactory Poor No opinion

Data accuracy	()	()	()	()	()
Data presentation	()	()	()	()	()
Timeliness of data	()	()	()	()	()
Completeness of data	()	()	()	()	()
Text clarity	()	()	()	()	()
Completeness of text	()	()	()	()	()

- #### 4. How can this report be improved?

5. May we contact you to discuss possible improvements?
